

Session 1 — Homework

HTML and CSS: finish and improve TaskFlow

Hand in before: the start of Session 2 **Time you need:** about 60–90 minutes for CORE

Objective

Practise the HTML and CSS we used today: classes, the box model, Flexbox, colours, borders, hover, and a media query.

You do **not** need any JavaScript for this homework.

Before you start

1. Open the TaskFlow project you have from the end of today's session.
 2. Make sure it opens in the browser and looks correct.
 3. Work in `index.html` and `css/style.css` only.
-

CORE — everybody does this

1. Add a footer

Add a footer at the bottom of the page, **after** the `</main>` tag.

It must:

- use the `<footer>` element,
- contain one line of text, for example: *TaskFlow - built during the frontend training.*
- be centred,
- use the grey text colour we used for small text,
- have a thin grey line above it,
- have space around the text so it does not touch the edges.

Hint: the header already has a line *under* it. Look at how that was done, then do the opposite side.

2. Make the task rows react to the mouse

When the mouse is over a task row, its border must change to the blue colour.

Hint: we did exactly this for the filter buttons.

CORE acceptance criteria

- ☐ A `<footer>` exists after `</main>` .
 - ☐ The footer text is centred and grey.
 - ☐ There is a thin line above the footer.
 - ☐ Moving the mouse over a task row changes its border colour.
 - ☐ Moving the mouse away puts the border back.
 - ☐ Nothing else on the page has changed or broken.
-

STRETCH — if CORE was comfortable

3. Better on a small screen

Make the page nicer on a phone-sized screen. When the window is **480px wide or less**:

- each filter button takes the **full width** of the row, one under the other,
- in each task row, the title and the status badge sit **on top of each other**

instead of side by side, and the badge lines up on the left.

Hint: you already have a media query for 600px. Add a second one for 480px.

Hint: you do not need any new tools — `flex-direction` , `align-items` and `width` are enough.

How to test: make the browser window very narrow, or open DevTools (F12) and use the small phone icon.

STRETCH acceptance criteria

- ☐ At 480px or less, each filter button fills the row.
 - ☐ At 480px or less, the task title is above the status badge.
 - ☐ On a normal wide screen, nothing changed.
-

CHALLENGE — for students who want more

4. A fourth statistic card

Add a fourth card called **Completion Rate** showing **33%**.

The number is written by hand — you are not calculating anything yet.

It must:

- look exactly like the other three cards (same class, no new colours or sizes),
- not squash the other cards on a normal screen,
- move onto a second line instead of becoming unreadable when the window gets narrow.

Hint: one new Flexbox property on `.stats` allows the cards to move to a second line.

Hint: a `min-width` on the cards stops them from becoming too thin.

CHALLENGE acceptance criteria

- ☐ Four cards, all with the same look.
 - ☐ You did **not** write a new CSS rule just for the fourth card's colours or font.
 - ☐ On a narrow window the cards wrap onto a second line instead of overflowing.
-

How to hand in

1. Make sure the page opens with no errors.
2. Keep your file structure exactly as it is:

```
index.html
css/style.css
js/app.js
```

1. Bring your project to the next session. Be ready to **explain one thing you changed**

and why you did it that way.

Reminders

- Use the class names we already have. Do not invent new ones unless you need a new thing.
- If your CSS does nothing, check the class name spelling in **both** files first.

- Write it yourself. Copying from the internet will not help you next session.
